ABSTRACT

Background: Schizophrenia is a functional psychotic disorder characterized by delusions, hallucinations, and disturbances in the process of thinking, perception, and behavior. Schizophrenia is a serious mental disorder that is chronic. **Objective:** To determine the Relationship of Knowledge Level and Family Support to Medication Compliance in Schizophrenia Patients in the Working Area of Cadasari Community Health Center. **Method:** The research method uses correlation with a Cross-sectional approach. **Results:** The results of the study showed that 24 people (82.8%) had good knowledge and were always compliant in taking medication with the results of the chi-square statistical test obtained $p = 0.003$ or (p value < 0.05) it was concluded that there was a relationship between family knowledge about schizophrenia and adherence to taking medication in schizophrenia patients. Meanwhile, family support for adherence to taking medication in schizophrenia patients was less supportive with the results of the Chi-Square Test obtained $p = 0.048$ or (p value < 0.05), so it can be concluded that there is a relationship between family support and adherence to taking medication in schizophrenia patients. **Conclusion:** There is a relationship between the level of knowledge and family support for medication compliance in schizophrenia patients in the working area of the Cadasari Pandeglang Community Health Center.
