Title : *Nursing Care for Patients Suffering from Schizophrenia with Auditory Hallucinations in the Edelweis Room Two RSKD Duren Sawit*

ABSTRACT

Background: Schizophrenia is a mental disorder that affects the brain and causes disturbed behavior, emotions and thoughts. Hallucinations are perceptual disorders where the patient perceives something that is not happening. **Purpose:** Writing this scientific work is to carry out holistic and comprehensive nursing care for schizophrenic patients with auditory hallucinations at RSKD Duren Sawit. **Method:** The method used in this scientific paper is the case study method. Data was collected through interviews with patients in the research These two patients were taken from RSKD Duren Sawit who experienced schizophrenia, auditory hallucinations, the data was obtained from the results of physical examination, observation, document study and library study. **Results:** what was found in patient 1 was being able to identify hallucinations, scolding, taking medication, having conversations, carrying out activities as well as in patient 2 being able to identify hallucinations, scolding, taking medication, having conversations, carrying out activities. **Conclusion:** After nursing care there was a decrease in signs and symptoms and an increase in the patient's ability to have auditory hallucinations. In patient 1, he was able to fulfill implementation strategies starting from implementation strategy 1 to implementation strategy 4 because the patient seemed cooperative, as well as in patient 2 he was able to carry out implementation strategies starting from implementation strategy 1 to implementation strategy 3. **Suggestion:** Implementation strategies 1 to 4 are expected to be implemented in patients with auditory hallucinations.
